## RETAIL PRODUCT DISPLAY

Showcasing flap discs, quick-lok discs, cut off wheels and more, your PREDATOR™ retail display will clearly stand out. Available as a pegboard or freestanding tower, our displays are free with any qualifying purchase. Contact your local ARC ABRASIVES, INC. Representative or Customer Service for more information.

# EXCLUSIVE PRODUCTS

## PREDATOR™

Like our new logo, the PREDATOR™ brand has evolved into more than just a product, but into a way of thinking and attacking the market to bring value and savings to American manufacturing. We started with an idea to develop a range of products that would prove to be of value to customers in cost and performance. This basis has served us well for the past 4 years. However, like our new logo, PREDATOR™ has morphed into an innovative, cutting edge technology. This thinking has been proven in products like our Rapid Release System and Performance Coating. These products will continue to define the market so that NO METAL STANDS A CHANCE!

## Samples

One very important part of our sales process is to provide samples for end user testing. We value our customers and make the delivery of your sample an important priority.

To share our knowledge of the metalworking industry, we allow you to request the specific samples needed. Going one step further, we can accompany you on a sales call to assist in closing your new opportunity.

*Our Direct Sales Force and Manufacturing Representatives are available throughout the United States, most of which cover a 200 mile radius.*

## EDI & Trading Partners

To ease ordering, we use an industry standard EDI exchange software for the 'Trading Communities.' This allows us to receive your orders electronically, alleviating the need to keep track of physical paperwork.

## Rebate Program

With a continuous interest in creating new business opportunities with our distributors, a rebate program can be offered for new sales. Not all distributor needs are similar, so we offer a wide range of incentive and rebates based on your preferences.

## Private Label Program

For select distributors, we can implement and apply an unbranded, or private label to both packaging and individual products with your company logo.

## Shipping Programs

Through our select carriers, we can ship overnight, provide competitive pallet rates, and drop ship directly to your customer. A free freight policy may also be available on select large orders.

# CAPABILITIES

## Productivity Analysis

Understanding how our products work within weld removal, deburring and flash removal, and surface finishing applications is critical. We are continually testing our innovative products on these applications and comparing our results to commonly used products and techniques. This gives us a very clear understanding of how our products will work for you and is the staple of our continuous improvement and product development. Let us show you how we approach every situation with our 5-Step Productivity Analysis.

### STEP 1: Determine Process

Perform an in depth abrasive cost savings study on-site. The purpose is to completely understand the following:

- a. Metals being worked with
- b. Fabrication processes in the shop
- c. Current abrasive applications
- d. Current products used
- e. Customer objectives

### STEP 2: Recreate Conditions

Duplicate the end user's conditions in our lab, eliminating testing in your facility, to develop a cost effective process for your particular abrasive application.

### STEP 3: Demonstrate Modifications

Return to the end user with our lab results to perform focused end user testing.

### STEP 4: Document Feedback

Document all test results with each operator in writing.

### STEP 5: Provide Cost Savings and Process Improvements

Compare pricing and testing results to document product and process savings.

# CASE STUDIES

## Agricultural Equipment

Manufacturer of agricultural equipment, including tractors, combines, hay tools, sprayers, forage and tillage equipment.

### Evaluation and Opportunity

Given the major operations involved with this manufacturer, several locations are utilized within the facilities. Although these operations are kept separate and involve different applications there is still product crossover between the two.

Acknowledging heavy stock and rust removal as separate applications, new products can be suggested to improve production efficiencies. Although the wire brush that is currently used for specific applications is a formidable solution, many other products can be adjusted or replaced for the benefit of remaining applications.

"...Saves hours of sandblasting..."

"...Removes all rust, not just the top layer..."

### Billed Time for Rust Removal

Location 1 .....	150 hrs/wk
Location 2 .....	125 hrs/wk
Combined Total .....	13,750 hrs/yr
Annual Billed Cost x Labor Rate .....	\$412,500

Reference  
Page 020

Lab Showcase

124

Based on performance results and operator feedback, we can estimate the following product rates:

Performance Improvement	New SCD Hours/Yr	Annual Savings
2 to 1 .....	6,875	\$206,250
3 to 1 .....	4,583	\$275,000
4 to 1 .....	3,438	\$309,375

Product	Usage	Savings
PREDATOR™ Quick-Lok Disc .....	39,360	\$9,052
PREDATOR™ Resin Fibre Disc .....	81,000	\$23,490
Zirconia Resin Fibre Disc .....	6,960	\$7,238
Surface Conditioning Disc .....	62,008	\$11,781
Total		\$51,561

# CASE STUDIES

## Earth Moving Equipment

Manufacturer of small earth moving equipment specializing in compact loaders, excavators and attachments.

### Evaluation and Opportunity

Several production departments were available for evaluation, including booms, mainframes, flat beds and rails. Most operators were using 9" 60 grit resin fibre discs on their various applications, with the addition of a knotted wire brush on certain welds.

The majority of all applications involved removal of large scratches or penetration marks and mill scale on mild steel plates or sheets. Relative to the required applications, large resin fibre discs are far too aggressive and their maximum potential is not realized.

ARC believes that we can provide better performance by product with a better base cost than what is currently being used as evidence in our mounted flap wheel quote and operator feedback. We provided a better mounted flap wheel at a \$1.53 savings per piece.

### Conclusion

ARC identified 3 main products that provide cost savings in cut, life and head to head product savings. ARC was \$1.53 less than the current flap wheel that was being used with equal performance. This one item was a \$53,000 savings. Additional items such as the resin fibre disc and flap disc showed a faster cut and a 2 to 1 increase in life with a lower product cost.

## Progressive Die Stamping

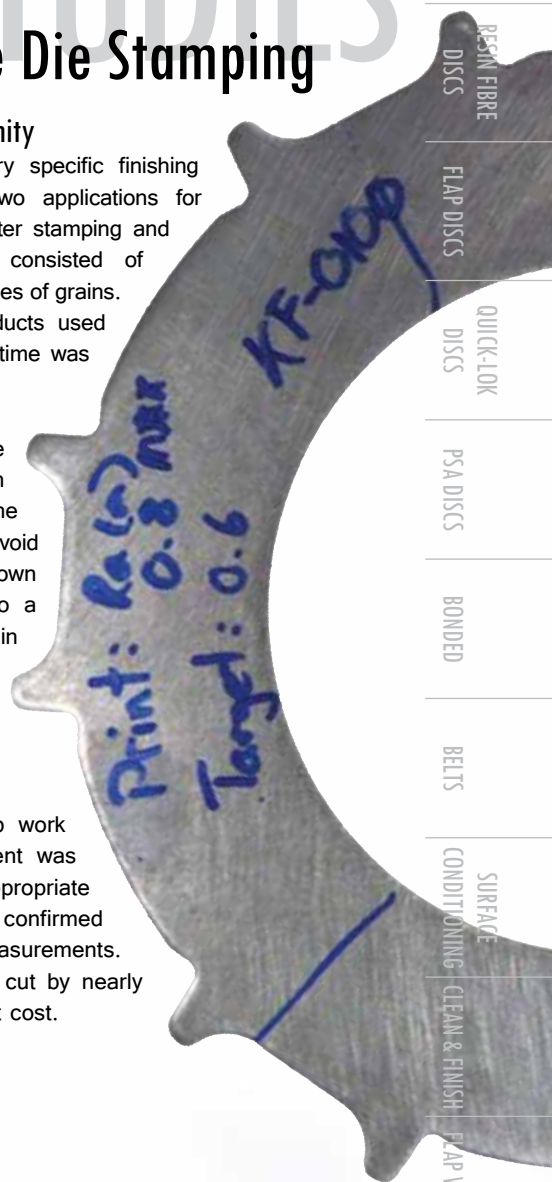

### Evaluation and Opportunity

This customer had very specific finishing needs that required two applications for each part - deburring after stamping and finishing. The process consisted of using several grits and types of grains. With many different products used on each machine, down time was significantly increased.

Product dressing time was used to wear down a new belt to match the required finish. To avoid wasting machine down time or dressing belts to a certain grit, a compact grain product could last 15 to 20 times longer without any dressing required.

### Conclusion

After much internal lab work each finishing requirement was matched with the appropriate compact grain size and confirmed by several surface measurements. Existing belt usage was cut by nearly 50% with a lower product cost.

# CASE STUDIES

## Aerospace Manufacturing

Manufacturer of military and private aircraft parts.

### Evaluation and Opportunity

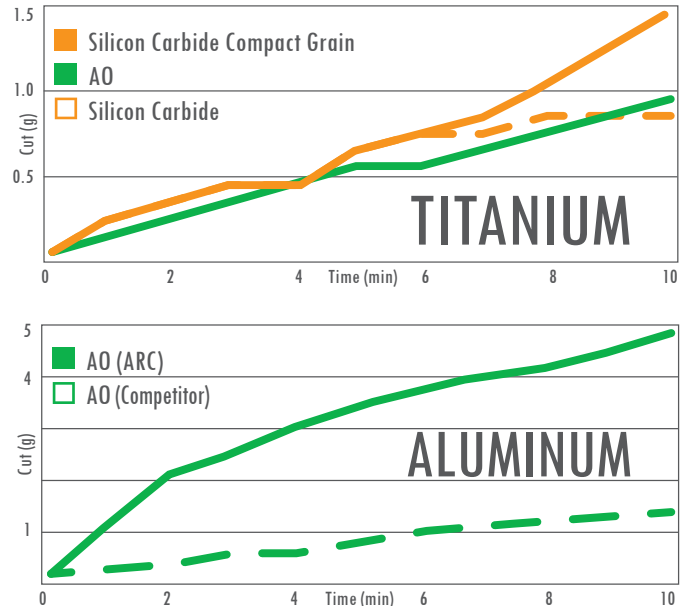

Operations involved removing machining marks from both titanium and aluminum parts. Conventional, single layer silicon carbide and aluminum oxide materials were used to smooth the flat surfaces and round outside edges.

The titanium parts generated so much heat that conventional abrasive grains broke down, quickly depleting product life. The use of a compact grain is similar in cost, but has a much longer life with faster cutting action.

Soft metals like aluminum melt and load into the grain structure, rendering products inoperable. Performance coating has the ability to limit loading by reducing heat and increasing performance nearly 10 to 1.

### Conclusion

The products that were recommended by ARC increased life and cut with a 25% reduction in product cost. The compact grain increased cut rate and usable life by 5 to 1 over the conventional silicon carbide discs that were being used.

## Aerospace Repair

Aircraft maintenance and quality control facility.

### Evaluation and Opportunity

Required processes included corrosion control, weld removal and general repair of titanium, nickel alloy and aluminum components.

Surface conditioning materials were currently used for corrosion control applications, but the current products were not lasting long. During evaluation ARC considered all surface conditioning grades in order to find the best balance of performance and finish.

Weld removal applications were required for all metals with titanium being the most demanding. The heat generated during grinding was actually melting the backing pad, sometimes rendering it useless after one application. Aluminum applications were treated differently, as the metal would melt, load the discs and prematurely deplete product life. This is the reason less expensive and much less technical aluminum oxide grains were being used.

### Conclusion

Equivalent materials were recommended for corrosion control applications, providing similar performance and finish while lowering costs. On titanium, performance increases of 25% to 200% were seen with silicon carbide compact grain, versus the conventional silicon carbide that was being used.

Operators were impressed with all of the recommendations that ARC provided, but they were especially appreciative of the performance coating recommendation for their aluminum components. The Performance Coated PREDATOR™ quick-lok discs easily increased existing performance by 169% on aluminum.

Reference  
Page 020

Lab Showcase

## Crane Manufacturing

International manufacturer of lattice boom and tower cranes.

### Evaluation and Opportunity

The initial evaluation revealed that product use was limited to removal of slag and burrs from oxy fuel cut mild steel parts with a 36 grit 7" flap disc. These particular flame cut parts are referred to as straps. Straps can vary from 6 to 20 feet in length and need to be deburred on both sides, top and bottom. Two to three operators spend an entire shift deburring these parts, so cut rate and overall life is important.

**"...A two or three to one advantage with PREDATOR™ ..."**

In most cases the use of 36 grit flap discs is not advised as the grain is too large and wants to shell off. The current disc had a soft edge that caused the product to flex and magnify the shelling problem. A finer 40 grit hard edge flap disc was recommended for improved cut and life.

### Conclusion

Operators were extremely pleased with the performance of the recommended PREDATOR™ hard edge flap disc. In most cases it outlasted previously used products by 3 to 1. The increased performance and life cut product changeout time and provided over 40% saving in product cost.

# LAB SHOWCASE

Our research and development lab allows us to perform automated and off-hand application testing, and the ability to break down each step of an application while supplying performance results and specific direction.

One of the many goals of our research and development team is to save you production time by recreating your conditions in our facility, versus using your shop floor. Per request, we can fabricate custom pieces on which to test, receive an actual work piece, or review a customer submitted application video.

We have assembled lab reports that have been issued at the request of end users or for internal comparative testing against existing products.

## Application Duplication

Send us your parts

Using customer submitted parts or custom fabrications, recommendations are well documented and extremely accurate.

# LAB SHOWCASE

Our Lab Reports reflect actual tests or requests from customers. Objectives and testing procedures are detailed by skilled technicians. Below, we segment a sample report.

## Quick application reference

To quickly associate our tests with your applications, use our reference table to tell you what metals and products are involved.

## Our objective for the test is detailed

Our reason for implementing a test is outlined.

## Products used are listed, including our SKUs

To learn more about a specific product used, reference the items listed in our Products chapter of the catalog.

## Equipment, techniques or recording methods are explained

Each test is different and may require unique equipment.

## Based on our results, our conclusions are presented

An assesment of our research is presented to conclude all tests.

Most belts made within 24 to 72 hours.

Compare stainless steel performance results of PREDATOR™ in 2" Quick-Lok Disc and 1/2 x 24" Belt form against leading competitive materials.

## ARC Products

**71-31656** 2" PREDATOR™ Quick-Lok Disc, 120 Grit  
**71-005024008** 1/2 x 24" PREDATOR™ Airfile Belt, 120 Grit

## Competitive Products

2" Quick Change Disc, 120 Grit  
1/2 x 24" Airfile Belt, 120 Grit

## Test Method

All tests were performed by hand using the appropriate tooling. Each test lasted for 20 minutes on several stainless steel welds, approximately 1/4" wide. The stainless work piece was weighed every minute, and the products were weighed before and after the test.

## Conclusion

The same weight was lost from each quick change disc tested, and the PREDATOR™ material outperformed the competitive material by 9%. Although both belts lost the same amount of material, the PREDATOR™ airfile belt was outperformed in cut by 41.6%.

**71-10825AF** 4-1/2 x 7/8" PREDATOR™ Flap Disc, 60 Grit

## Competitive Products

4-1/2 x 7/8" zirconia alumina, ceramic or mixed material flap discs from three manufacturers.

## Test Method

Tests were performed using an automated test machine powered by a flex shaft motor running at 14,400 RPM for 40 minutes, or until the product ceased to cut. Ten pieces of 12 x 2 x 1/4" mild steel were used, each weighed every minute of the test to determine cut rate.

## Conclusion

Against the five manufacturers tested, PREDATOR™ flap discs provided the highest performance, in both 40 and 60 grits, by a margin of at least 11%.

### Competitive Products

4-1/2 x 7/8" Flap Disc, 60 Grit

1/2 x 1-1/2 x 1/8" Silicon Carbide Cartridge Roll

### Test Method

Flap discs were tested by hand with the use of a right angle grinder operating at 10,000 RPM. The work piece was weighed every minute to determine cut rate, and the discs were weighed before and after the test.

Cartridge rolls were tested by hand using a small pneumatic right angle grinder for 10 minutes, or until the cartridge roll was deemed unusable. The same methods for determining flap disc cut rates were used for cartridge rolls.

### Conclusion

Both of the silicon carbide compact grain flap discs outperformed PREDATOR™ on titanium by 90% or more in cut. The compact grains were able to break down, while all other materials tested glazed over due to the heat of the titanium during grinding. Hard Edge PREDATOR™ flap discs performed two times better than silicon carbide compact grain materials on aluminum. However, Performance Coated PREDATOR™ Hard Edge flap discs performed approximately 3.5 times better than all silicon carbide compact grain discs on aluminum.

The X-Weight silicon carbide compact grain cartridge rolls performed well on titanium, and the ARC ABRASIVES, INC. product outperformed the competitor by 60%. All of the J-Weight cartridge rolls completely fell apart at 5 minutes, and were cutting 100% less than our silicon carbide compact grain material at the end of their life.

### Products Used

**71-30441** 5" PREDATOR™ PSA Disc, 60 Grit

**71-30442** 5" PREDATOR™ PSA Disc, 80 Grit

5" Aluminum Oxide J-Wt PSA Disc, 60 Grit

5" Aluminum Oxide J-Wt PSA Disc, 80 Grit

5" Aluminum Oxide F-Wt PSA Disc, 60 Grit

5" Aluminum Oxide F-Wt PSA Disc, 80 Grit

### Test Method

Each disc was used with an electric orbital sander at a speed of 12,000 RPM removing as many mild steel spot welds as possible in 5 minutes. The metal was weighed every minute to determine rate of cut and each disc was weighed before and after the test to document product life.

### Conclusion

Both 60 and 80 grit PREDATOR™ PSA discs outlasted the J and F weight paper discs by 150%. The 60 grit PREDATOR™ disc cut over 300% more, while the 80 grit cut nearly 250% more than either paper disc.

When considering cut, life and finish, the 80 grit PREDATOR™ PSA disc provides the best overall performance.

# LAB SHOWCASE

## 172

Stainless Steel

Aluminum

Titanium

Quick-Lok Disc				
Resin Fibre Disc	•			
Flap Disc				
PSA Disc				
Belt				

Document our material removal rates against top competitors commonly used for similar mild steel applications.

### ARC Products

**71-047802** 4-1/2 x 7/8" PREDATOR™ Resin Fibre Disc, 36 Grit

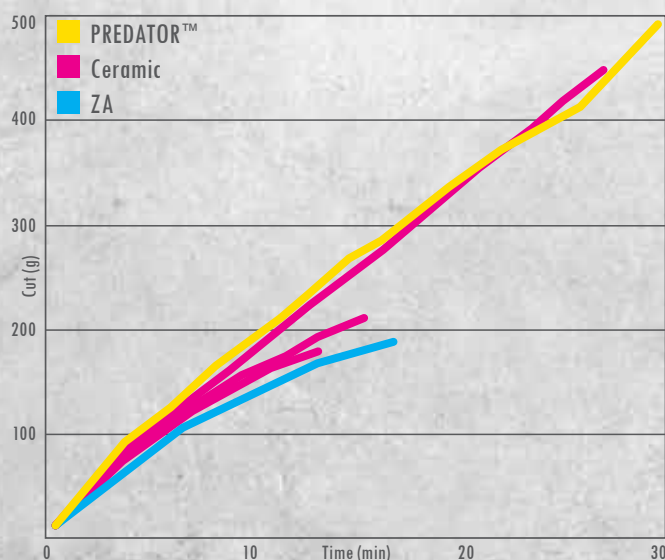

### Competitive Products

4-1/2" x 7/8" Assorted Top Competitors, 36 Grit

### Test Method

Each disc was tested by hand using a 4-1/2" angle grinder at 10,000 RPM. The goal was to remove as many 6" x 1/4" welds on a mild steel bar. The test was noted as complete once a disc was deemed to have stopped cutting or the cut rate had dropped significantly.

Each piece of mild steel was weighed before and after each weld was removed. Each disc was weighed at the start and end of the test to establish the life of the disc. The time needed to remove the weld was recorded to establish the removal rate.

### Conclusion

PREDATOR™ and the next leading contender were similar in performance, but remaining competitors cut slower and only lasted approximately half of the test.

## 395

Mild Steel

Stainless Steel

Aluminum

Titanium

Quick-Lok Disc

<b>71-31653W</b>	2" PREDATOR™ Quick-Lok Disc, 60 Grit
<b>59341</b>	2" Type R Quick-Lok Disc, CRS
<b>71-30444W</b>	5" PREDATOR™ PSA Disc, 120 Grit

## Test Method

All resin fibre discs were tested by hand using an electric angle grinder operating at 6,000 RPM. Intentions of the test were to allow each disc to remove as many 12" aluminum welds as possible.

Using a small pneumatic right angle die grinder, the coated quick change discs were tasked with removing as many 2" aluminum welds as possible before depleting their life. The surface conditioning discs were then used to clean the work area.

Each occurrence of a weld completely removed was timed and documented, as was the time to clean the areas removed after weld removal.

PSA discs were tested using a pneumatic orbital sander by hand. Unused discs were tested on both a bare aluminum plate, and a layer of two-part body filler applied to each 12 x 12 x 1/4" plate. The bare plates were ground for 10 minutes by each disc, whereas the body filler was only ground for five minutes. Surface profile measurements were taken from the bare plates every two minutes to document the finishing properties of each PSA disc. The metal work pieces were weighed before and after each test or, in some cases, every minute to determine cut rates of the various products.

Comparing performance of an existing series of aluminum applications, ranging from heavy stock removal to moderate surface finishing.

## Customer

Manufacturer of custom fire trucks such as aerials, pumpers, rescues, tankers and specialty vehicles.

## Competitive Products

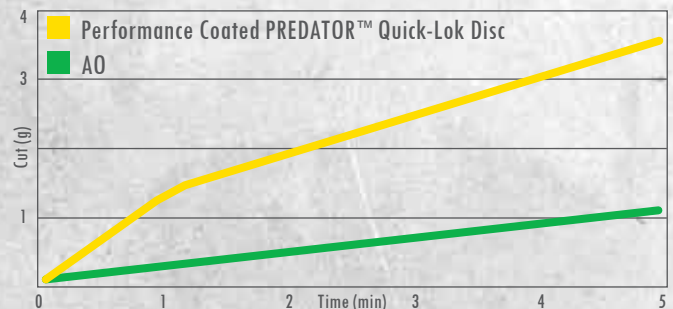

7 x 7/8" Resin Fibre Disc, 36 Grit
2" Quick Change Disc, 60 Grit
2" Surface Conditioning Quick Change Disc, CRS
5" PSA Disc, 100 & 500 Grit

## Conclusion

Performance Coated PREDATOR™ resin fibre discs were able to remove 60" of aluminum weld material quicker than the competitive material, which could remove only 10", at which point it was deemed to have stopped cutting.

PREDATOR™ quick-lok discs were able to remove 6" of weld material in 2-1/2 minutes, versus the 3 minutes taken to remove 2" of material by the competitive material. After cleaning each work area with the surface conditioning discs, the resulting finishes were extremely similar.

All PSA disc tests showed increased efficiency and performance with PREDATOR™ materials. Surface profile measurements were recorded and PREDATOR™ materials ended with a finish slightly coarser than the competitive materials.

<b>54141</b>	3 x 2 x 1/4" Interleaf Mounted Flap Wheel, 320 Grit
<b>07450</b>	6 x 9" General Purpose Handpad, AL SIL

## Test Method

Our process steps involved stock removal to scratch removal and surface blending. Starting with a PREDATOR™ flap disc, welds were removed on each plane of the provided appliance control panel. The 120 grit scratches were then removed with 320 or 400 grit compact grain quick-lok discs, and blended and finished with a hook and loop film disc.

The remaining smaller welds were initially removed with compact grain quick-loks, again followed by a small diameter hook and loop film disc, using a small orbital sander.

Less severe scratch or swirl marks were finished with a general purpose handpad or, depending on the particular geometry of the piece, an interleaf mounted flap wheel.

## Conclusion

Each face or outside corner of the provided range top control panel can be finished within seven steps, providing a consistent finish suitable for showroom use. The new processes can be completed in approximately 7 to 12 minutes, per face. Results were presented to the customer for comparative analysis against their current processes.

- 2" Surface Conditioning Quick Change Discs, MED and VFN
- 6" Paper PSA Disc, 400 Grit
- 3" Reinforced Cut Off Wheel
- 4" Reinforced Cut Off Wheel

## Test Method

Our customer manufactured specific work pieces to be used for our testing, consisting of aluminum, which allows us to formulate accurate performance of existing products. The quick change discs and PSA discs were tested for 10 minutes by hand using a pneumatic right angle die grinder and pneumatic orbital sander, respectively. The work pieces were weighed every minute, and a surface profile measurement was taken following the test.

The reinforced cut off wheel tests were performed with an automated flexshaft machine operating at 15,000 RPM. The weight and outside diameter of the wheel were documented before and after the test was done. Tests consisted of making 40 or 50 cuts, depending on wheel diameter, on an extruded aluminum tube of 3/4" diameter.

## Conclusion

80 grit, Performance Coated aluminum oxide quick-lok discs outperformed comparable competitive discs by 73%, and the 120 grit was an improvement by 75%. The MED and VFN quick-lok discs outperformed current products by up to 33%. ARC's SPECTRA™ Paper Disc outperformed one competitive paper disc by 50% in performance. ARC's 3" Performance Coated Cut-Off Wheel made all 40 cuts, while the current Aerospace product wore away quicker and could only make 23 cuts in the same amount of time. ARC's 4" Performance Coated Cut-Off Wheel made its 50 cuts 35% faster in time than one competitor could on the same 50 cuts, and ARC's wheel wore out less than the competitor wheel.

2" Aluminum Oxide Quick Change Disc, 120 Grit

2" Surface Conditioning Quick Change Discs, MED and VFN

### Test Method

All quick change discs were tested with an automated flex shaft tool on aluminum and titanium, at 6,800 RPM and 15,000 RPM, respectively. The aluminum test piece was of 12 x 12 x 1/4" bar form, and the titanium was cut into 6 x 6 x 1/4" plates. Surface profile measurements were documented from the surface conditioning tests on aluminum.

### Conclusion

On aluminum, Performance Coated PREDATOR™ quick-lok discs were able to cut 169% more than the competitive material currently used by our customer.

The 80 grit silicon carbide compact grain discs proved better than top performing competitive materials on titanium by 25%; however, the 120 grit discs improved existing performance by over 200%.

Surface conditioning materials proved to be similar in performance and finish on aluminum, with marginal maximum cut rate differences of 0.6g.

Comparing performance and finish qualities of aluminum oxide compact grain and conventional aluminum oxide PSA discs.

## ARC Products

5" Aluminum Oxide Compact Grain PSA disc, 180 Grit

## Competitive Products

5" Aluminum Oxide PSA disc, 180 Grit

## Test Method

Using a pneumatic orbital sander, each disc was tested by hand on 12 x 12", 16 gauge stainless steel plates. The completion of each test was determined by a substantial drop in material removal, or once a disc stopped cutting. The steel plates were weighed every minute to calculate cut rate, and discs were weighed before and after the test to determine product life. A surface scratch measurement was taken every two minutes to determine the finish.

## Conclusion

The aluminum oxide compact grain PSA disc lasted 50% longer than conventional aluminum oxide, and outperformed cut rate by 81%. Consistent surface scratch measurements between the two products were taken after several readings.

## Heavy Mild Steel Fabrication

### Description

General steel fabricators of plate and structural steel.....	Jacobs Incorporated
Mild steel tanks and general plate fabrication .....	Chicago Metal Fabricators
Farm equipment manufacturers .....	CNH, John Deere, Kubota
Military Vehicles, including tanks.....	United Defense Systems
Earth moving equipment manufacturers.....	Caterpillar, Kobelco, Vermeer

### Metals Used

Primarily plate and structural mild steel grades such as A36, AR400, 4140, 8620 and PVQ.

Heavy mild steel fabrication can be broken into two major categories. The first consists of finished products such as tanks, farm equipment and earth moving vehicles. The second includes mild steel fabricators that supply the individual components of the finished products. These companies make a wide variety of weldments per print, and larger companies will typically bid hard to fabricate parts to this second group.

Both of these groups follow three main applications: removal of large MIG welds on fabricated parts; surface finishing on all parts not sandblasted before paint; and general deburring of thermal and mechanically cut parts. These three applications will include approximately 90% of the abrasives usage.

General steel fabricators have a flexible working environment to produce a wide variety of parts. Most general plate manufactures have thermal and mechanical cutting, bending, rolling, MIG welding and finishing capabilities.

Farm equipment manufacturers make a variety of combines, spreaders and general farming equipment, primarily from mild steel sheet or plate. All companies are precision fabricators with a great selection of laser, forming and MIG welding equipment. Metal conditioning equipment is also used, as final appearance is important.

Military vehicles include tanks, transports, and other ground based vehicles. The military and their contactors focus applications on general mild steel grades, but also some high alloy grades. Capable of fabricating materials from 3 inch plate to 20 gauge steel sheet, thermal and mechanical cutting equipment, MIG welding and finishing equipment are all commonplace.

Earth moving equipment manufacturers are similar to military vehicle fabricators, using plate mild steel and high alloy materials. Premier metal fabrication abilities include laser, plasma, oxy fuel and mechanical cutting, and the ability to bend, form and weld difficult to fabricate weldments.

# MARKET OVERVIEW

## Light Mild Steel Fabrication

### Description

Lawn and garden tractors; Home lawn and garden equipment..... Kubota, John Deere, Honda  
Sheet metal work ..... Metaldyne  
Automotive and other stampings ..... Jefferson Southern Corp.

### Metals Used

1018, 1008, A36, HSLA, Abrasion Resistant

Focused on cold rolled sheet fabrication, companies manufacturing lawn mowers, small tractors, work and sport utility vehicles know final appearances are critical. These companies use several abrasive products per facility. To uphold appearance, visible welds are removed to a 150 grit finish before painting. Depending on the location of the weld, a variety of flap, resin fibre or quick-lok discs, belts or PSA discs may be used.

Lawn, garden and light equipment manufacturers utilize a wide variety of fabrication processes, including state of the art thermal and mechanical cutting, and light MIG and TIG welding, all of which may require many types of grinding and finishing applications.

Automotive and other stamping companies produce a wide range of parts. Most require light finishing, but the most common application is removing burrs by hand after a part has been stamped.

Similar to fabricators of heavy plate steel, laser cutting, bending and finishing are primary processes for steel sheet fabricators. With this range of activities, many types of abrasives may be used for both light grinding and finishing applications.

## General Aluminum Fabrication

### Description

Architectural and ornamental metalwork ..... Triangle Metals  
Boat building and repair ..... Tracker Boats  
Truck trailers..... Great Dane

### Metals Used

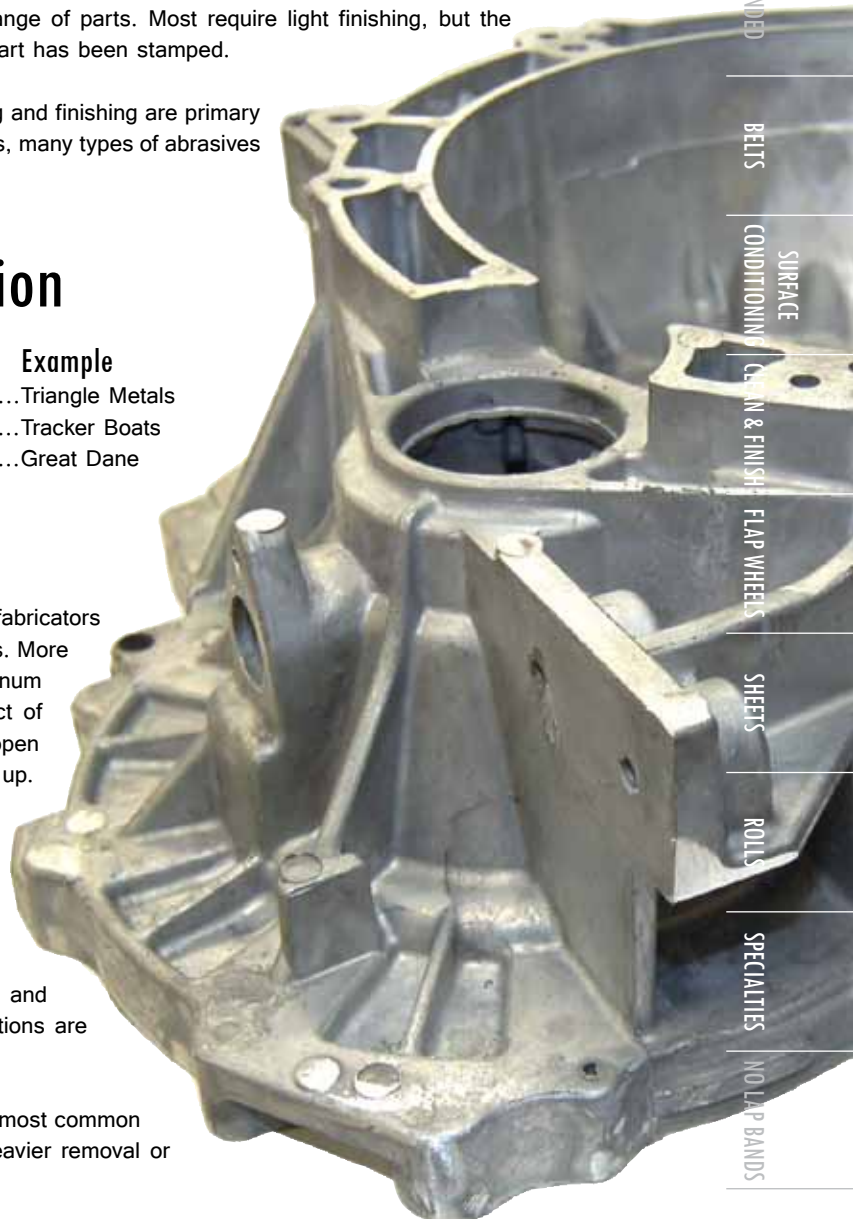

Aluminum; 2024, 6061, 7075

From general fabrication to industry specific, aluminum fabricators commonly see both weld removal and weld cleanup applications. More technical boat and aircraft companies will finish every aluminum part, as it will be painted and appearance is a critical aspect of the finished product. A variety of discs are used, but semi-open PSA discs are recommended for mill scale and general clean up.

Architectural and ornamental metalworking companies specialize in attaining a particular finish for fabricated parts. These parts could include railing, decorative plates or structural shapes.

Aluminum boat building and repair encompasses fishing boats and ferries to military boats and luxury yachts. The common functions are welding, fabricating and finishing of aluminum plate.

Aluminum is not exclusive to truck trailer fabrication, but is the most common metal used. Typically, parts are cleaned and painted, after heavier removal or finishing applications.

# MARKET OVERVIEW

## Aerospace Manufacturing

### Description

### Example

Aircraft manufacturing.....	Boeing Co.
Aircraft maintenance .....	First Wave
Aircraft engine manufacturing .....	General Electric Co.
Other aircraft parts .....	Pryer Machine

### Metals Used

Titanium, High Nickel Alloy, Stainless, 6061 and 7075 Aluminum

Aircraft manufacturers machine and fabricate a variety of titanium, stainless and aluminum parts. Given the complexity of aircraft, several levels of fabrication and assembly are required, although engine and landing gear assemblies may be outsourced. Common abrasive applications include light material removal and blending or removal of machining marks from titanium and aluminum. Surface finishing of aluminum wing and fuselage components are also commonplace.

Repair and routine maintenance of aircraft parts, such as non-engine or wing components will usually involve some form of finishing, after the critical work has been completed.

Aircraft engine manufacturers, such as Pratt & Whitney or GE Aviation, use and machine exotic metals like proprietary high nickel alloys and various titanium grades. Most of the fabrication involves turbine blades, shrouds and airfoils. Refining machining marks and removing spot welds are the most common applications seen.

## Non-Ferrous Foundry

### Description

### Example

Aluminum die casting .....	Able Die Cast
Non-ferrous die casting .....	JL French Co.
Aluminum foundry.....	Milwaukee Precision Casting

### Metals Used

Cast aluminum, brass, bronze and copper

Non-ferrous foundries specialize in melting and casting desired shapes used in automobiles, motorcycles, plumbing fixtures, train locomotives, airplanes or as decorative art pieces. Foundries are divided between sand casting and investment casting processes. Sand casting is typical for larger, less complex shapes while investment casting is for small, intricate parts. Both types of casting create flash and gate materials that need to be ground flush to the part.

Larger companies may outsource parts to a finishing specialist, who may use air tools with carbide burrs to take down parting lines and perform general shaping of the parts. An alternative to carbide burrs are small diameter coated or nonwoven discs and combination wheels, such as interleaf mounted flap wheels.

Aluminum and other soft metals can be cast using a metal die, rather than a sand or investment process. This is the cleanest form of casting, but flash, gate and parting line removal may still be necessary.

# MARKET OVERVIEW

## Stainless Steel Fabrication

### Description

Food products machinery fabricators .....	Paul Mueller Co.
Special food products machinery .....	Stainless Fabricators Co.
Packaging machinery .....	Fleetwood Inc.
Industrial valves .....	Alfa Laval Tri-Clover
Architectural and ornamental metal work .....	Irving Metal Polishers

### Metals Used

Stainless Steel, Austenitic, 304, 316

Stainless steel fabrication is an extremely diverse market with demanding applications. From ID bore polishing to flat finishing a specific Ra value, or roughness average, stainless fabricators follow technical requirements for their applications. The stainless fabrication industry commonly measures scratch depth and relies on the aesthetic finish of products, ranging from tanks and piping to structural components.

Food, beverage and pharmaceutical equipment fabrication is extremely specialized, and so are the processes involved. Intense finishing requirements mandated by the FDA command a specific catalog of abrasive applications. Packaging machinery is similar to food, beverage and pharmaceutical equipment, due to the similarities in materials used.

Industrial valves or fluid transfer valves also require FDA mandates, in which the internal tubing must meet a required finish to pass inspection.

# COATED ABRASIVES

The cutting power of an abrasive grain is dependent on shape, hardness, toughness and orientation. All four factors control the penetration of cut and the life of the grain. The shape of the grain governs the cutting efficiency. Sharper grains produce a cleaner cut and tend to stay cooler during use. Blocky grains give a rougher cut and create more friction. It is understood that different applications require different types of abrasive grain.

\* Grains shown at 1000%

\* 36 Grit

## Aluminum Oxide (AO)

Fused aluminum oxide is the most common abrasive grain in use today. AO is extremely tough and durable but has no clearly defined crystal structure. This means that when the grain eventually wears it produces rounded edges which reduce cutting power. Brown aluminum oxide is the usual grain for coated abrasives products but is also available in white, pink and other variants.

### Suggested Applications

Aluminum and ferrous metals, including alloy steel

- Brown or brownish-red man-made abrasive
- Durable with tough cutting edges
- Wear resistant and long lasting, even under stress applications

## Zirconia Alumina (ZA)

Zirconia alumina is best described as an alloy of aluminum oxide and zirconia. During manufacturing the two components are quenched from molten form which gives the grain a crystalline structure. Under heat and/or pressure the structure fractures producing new cutting edges. This gives the grain a longer cutting life and is especially suited to coarser stock removal applications.

\* 36 Grit

### Suggested Applications

Heavy duty grinding on all ferrous and non-ferrous metals

- Ultra rugged synthetic abrasive that self-sharpens as it cuts
- Sharper, more blocky grain than aluminum oxide with large fracture planes
- Commonly used for heavy grinding applications where a cool cut is required
- Available only in coarser grits; bluish gray in color

## Compact Grain

Individual grains are clumped, or clustered together to form a larger grain shape. This type of large grain construction will give extended life when compared to conventional abrasives. Compact grain is ideal for finishing applications on any metal in belt, PSA and quick-lok disc form.

\* 80 Grit

### Suggested Applications

Mild and stainless steel, titanium and nickel alloys. Not suggested for non-ferrous materials.

- Long life finishing applications
- Available in belt, PSA and quick-lok disc form
- Aluminum oxide and silicon carbide options

## Silicon Carbide

Silicon carbide is the hardest of all common abrasive materials. It is very sharp, but friable, leaving new sharp edges for cutting. For this reason, it is initially fast cutting, but short in life. It is ideal for use on non-ferrous metals like aluminum, brass, bronze, magnesium and titanium. For final finishing, the sharp crystal structure produces fine, straight edged grind lines that reflect light better than the rounded aluminum oxide grind lines.

\* 40 Grit

### Suggested Applications

Non-ferrous metals, non-metallics

- Hard, sharp, synthetic abrasive, black in color
- Grains fracture to continually expose new cutting edges
- Permits fast stock removal

## Ceramic

Unlike fused aluminum oxide, ceramic aluminum oxides are formed via a chemical process. The grain from this process comprises millions of smaller crystals which fracture off during use and continuously form a new cutting surface. This self-sharpening process requires heavy pressure to ensure that the grains do not glaze.

### Suggested Applications

Highly recommended for high heat applications on stainless steel, titanium and high nickel alloys. Ceramic works best in coarser grits in belt, quick-lok and resin fibre disc form.

- Self-sharpening grain
- Cuts at rated grit throughout its life
- Controls heat during the grinding process
- High cut rate

\* 36 Grit

# COATED ABRASIVES

## Vulcanized Fibre

Vulcanized fibre is a product made from cotton rags and treated with chemicals to form a gelatinous substance which is then layered into plies. The plies are heat vulcanized and calendered to give a strong and stiff base material. Due to its high stiffness, vulcanized fibre products can only be used in disc form such as resin fibre discs. The recommended use is for heavy duty stock removal, typically in grits 80 and coarser.

### Suggested Applications

Fibre is a hard, durable material with great mechanical strength, used to make resin fibre discs. Used in aggressive operations.

## Cloth

The first two cloths in the U.S. market were cotton drills (X-wt.) and cotton jeans (J-wt.), both utilized a twill weave. Drill uses fewer yarns per inch but each yarn is heavier. The next advancement was a heavier weight drill commonly known as Y-wt. Sometimes an F is added as a suffix to denote extra flexing (e.g. JF and XF).

Cotton was the first cloth available. However, synthetic cloths, polyester and polyester/cotton mixes have become more prominent as they tend to be stronger and more stable in use. The synthetic polyesters are inherently waterproof while the cotton products need treatment to be waterproof.

### Suggested Applications

Mechanized belt, disc or wheel applications.

### Options

The two types of cloth backings offered are cotton and polyester. Cotton is lightweight and flexible, but not waterproof. Polyester backings are stronger than cotton. In addition, they are waterproof, fray resistant and they absorb shock.

# NONWOVEN ABRASIVES

To understand the cutting action of nonwovens, imagine the grit particle held by a helical spring rather than a solid block. As a nonwoven product runs over a contoured surface the “springs” compress and expand allowing the grain to constantly be in contact with the entire surface. A coated product would skip over the valleys and remove excess metal on the peaks as the force of application would be concentrated on the smaller area of the peaks. The nonwoven finishes more uniformly contoured surfaces without compromising critical tolerances obtained in earlier machine or molding operations. This feature is especially important during a finishing process.

The conventional method for removing deep scratches is to use a progression of coated abrasives, e.g. 80, 120 and 180 grit, each giving a progressively finer finish while removing the previous deeper scratch. The conforming nature of nonwovens allows deeper scratches to be removed while providing a fine finish. This reduces the number of steps in the process – a major savings in labor costs.

The wear characteristics of nonwoven abrasives are different from coated abrasives. In use, the abrasive grain within coated abrasives wears down and changes shape which results in different scratch patterns. With nonwoven abrasives, as the product wears away, the substrate breaks down and the grain is lost which reveals a new sharp grain. This process leads to uniform finishing throughout the life of the product.

In nonwoven abrasives the fibre and resin are fully waterproof so the product can be used wet or dry. The structure of a nonwoven abrasive is extremely open so that the product resists loading and is cool running.

## Coated Finish vs. Nonwoven Abrasive Finish

Grit Size	Clean & Finish Range	Surface Conditioning Range	Grit Size
60			60
80	Extra Cut (Brown)		80
100			100
120			120
150	A Medium (Tan) S Medium (Black)	A Coarse (Brown)	150
180		A Medium (Maroon)	180
200			200
220	A Fine (Maroon)		220
240	General Purpose (Green)		240
320	A Very Fine (Maroon)	A Very Fine (Blue)	320
400			400
500			500
600	S Ultra Fine (Gray)	S Superfine (Gray)	600
800			800
1000			1000

# Surface Conditioning

Surface conditioning materials, or SCM, have the basic nonwoven structure but are scrim reinforced and are one-sided. The scrim adds strength for use in high speed belt and disc operations.

For airfile belts, the base nonwoven is modified to give increased flexibility as the belt has to travel around a small diameter contact wheel (less than 1") without cracking. For longer belts the base has been modified to resist stretch in the length direction. Discs and quick-lok discs use a regular scrim product.

# Cleaning & Finishing

Non-reinforced, or clean and finish (C&F) products are made of the nonwoven base and have not been reinforced with a woven scrim.

## Performance Qualities

The performance qualities of SCM and C&F products versus coated abrasives are notable, as there is little overlap in use.

The conformability of nonwoven products leaves them less likely to gouge a work piece, avoiding disturbances to critical tolerances. The 3D structure disperses abrasive grains for a uniform scratch pattern throughout product life, and requires fewer finishing steps than coated materials.

The open structure of nonwoven material is resistant to loading. The synthetic components are also waterproof and resistant to cutting fluids and other metalworking chemicals.

## Suggested Applications

Surface conditioning, which is generally performed near the end of a manufacturing process, refers to the changing of a product's surface without damaging or removing the base material. Typically used in mechanical operations, surface conditioning products include belts and discs.

Clean and finish nonwoven products are typically hand-operated type products. They are much weaker in nature than surface conditioning products, because not as much grain, fibre and resin is used in the production of these products. Clean and finish products include hand pads, sheets, rolls and flap wheels.

Performance Coating available on select nonwoven products.

# PRODUCT OVERVIEW

## PREDATOR™

Aggressive steel applications produce substantial heat during grinding, resulting in shortened disc life. A resin fibre disc is intended for aggressive applications, but the grain structure determines product longevity.

By reconstructing our proprietary blend of PREDATOR™ grains in resin fibre disc form, we have achieved top-tier gram removal ratios for both mild and stainless steel applications. PREDATOR™ resin fibre discs provide a long-lasting, aggressive cut throughout their life and reduce heat with an integrated grinding aid.

## Rapid Release

Our patent pending rapid release system was developed not only to provide a quick change process, but to challenge the industry standard of adding an expensive button. The quick change function of the resin fibre disc requires no tools and can be performed nearly 75% faster than standard disc and tooling assemblies.

Along with established labor and productivity savings, our rapid release resin fibre discs can be as little as half of the cost of competitor discs.

# RESIN FIBRE DISCS

## General Purpose

### ALUMINUM OXIDE

Due to loading from soft metals, product disposal can be frequent. Aluminum oxide is the most affordable choice for softer metals, relieving some of the cost associated with waste. Situations in which technical grains like zirconia alumina or ceramic are excessive, aluminum oxide is the optimal choice.

### ZIRCONIA ALUMINA

An affordable, general purpose material, zirconia alumina provides consistent removal rates, especially in finer grits. Zirconia alumina is not recommended for high production environments in which extra-long life and faster material removal are critical.

## Performance Coating

Fabricators of soft metals are continuously frustrated by the inability to reduce loading during aggressive grinding applications. Due to the softer structure of aluminum, it overloads the functional surface area of abrasive grains, quickly ending productivity.

Performance Coated products offer exceptional cut and an ability to reduce loading, while also controlling heat during grinding. The integrated material enhancement realizes the full potential of the grain structure, allowing resin fibre discs to perform as they would on hardened steel.

In a head-to-head test, our untreated disc took 600 seconds to remove 30 grams, and only 75 seconds for the performance coated disc to remove the same amount of material.

# APPS & SOLUTIONS

## Mild Steel

### APPLICATION

Using a resin fibre disc for heavy material removal is a common application performed by many fabricators. Mild steel and its alloys do not generate enough heat during grinding to justify some full ceramic materials; however, several manufacturers promote these more expensive materials to mild steel fabricators. The cost of some full ceramic discs can nearly double for only a 10% increase in material removal.

### SOLUTION

PREDATOR™ and its proprietary blend of grains were designed specifically for mild steel. With an extremely high ratio of material removal and life, PREDATOR™ works well throughout its grit range on both heavy and light mild steel removal applications.

*Reference Lab Showcase 172 on Page 014*

## Stainless Steel

### APPLICATION

Coarse grit resin fibre discs are best suited for larger stainless steel MIG welds, while smaller TIG welds may only require 50 grit or finer. Regardless of the weld type, stainless material removal applications generate large amounts of heat.

### SOLUTION

PREDATOR™, and its blend of self-sharpening grains and two grinding aids easily reduces the heat generated while grinding stainless steel. PREDATOR™ resin fibre discs are an ideal choice for stainless applications, when compared to ordinary zirconia and aluminum oxide materials.

*Reference Lab Showcase 395 on Page 014*

## Aluminum

### APPLICATION

Due to the excessive loading from aluminum during grinding, several unsuccessful solutions have been considered. Beeswax or messy lubricants attempt to extend product life, and less technical abrasives are chosen to limit cost. Unfortunately, aluminum oxide grains are often used, which increases heat and loading, even compared to zirconia alumina.

### SOLUTION

An integrated material enhancement can dramatically improve life and cut rate over a standard grinding aid. Performance coating has been proven to increase both life and cut rate of our PREDATOR™ resin fibre discs; in some cases by nearly 400%. Performance coated products will not contaminate welds and can be painted over without any effect to the finish.

*Reference Lab Showcase 419 on Page 015*

# RESIN FIBRE DISCS

- Ideal for mild steel
- Self-sharpening grains
- Cost effective option to full ceramic materials

- Ideal for aluminum & non-ferrous
- Increased cut rate
- Reduced heat transfer
- Extended product life

# PRODUCT OVERVIEW

## Hard Edge Geometry

Hard Edge discs have a shape similar to our Type 29, or angle faced discs, but are engineered for extremely fast material removal using a reduced amount of pressure. This is accomplished by compressing the outside rim of the flaps to eliminate flexing during the grinding process. Ordinary flap discs can flex over the work surface causing grains to shell or shed prematurely, resulting in longer grind times and shorter life. Hard edge discs provide a faster cut and longer life in coarse grits because they retain the abrasive grains so well.

## PREDATOR™

Flap discs provide the added benefit of finer finishing after aggressive grinding, compared to resin fibre discs. The dimensional layering of flap discs allow the continual exposure of abrasive grains, versus one layer of grains. Flap discs contain just as much working surface as resin fibre discs, but within a much smaller diameter. This geometry is responsible for the versatility of a flap disc. The integrated grinding aids utilized in PREDATOR™ materials help with longevity and cooling.

After a 20 minute automated grinding test, our PREDATOR™ flap disc cut over 100 grams more than the next leading competitor. Although the disc may look worn, it continues to cut for extended periods of time.

# FLAP DISCS

## Flap-Disc Options

### Mini Flap Discs

Flap discs provide aggressive material removal on all metals, but lack access to tight areas. Like quick-lok discs, mini flap discs can reach small areas in need of grinding but suit the needs of heavy material removal. Mini flap discs are used with a Type S Quick-Lok Disc Holder, retaining the time-saving changeover of quick-lok discs. From aggressive grinding to fine finishing with the benefit of a small diameter, PREDATOR™ Mini Flap Discs are an extremely versatile product.

### General Purpose

#### ZIRCONIA ALUMINA

An excellent general purpose abrasive, ideal for use on steel, aluminum and composites. The cotton backing adds strength and durability to a very competitive product.

#### ALUMINUM OXIDE

Especially suited for use on stainless steel or cold rolled steels, aluminum oxide flap discs are self-lubricating to avoid over-heating of the work piece. The size coat and top size coat also aid reduced clogging and improve the resulting finish.

#### ARBOR

Several flap discs may be used in any given time period. If a quick change out is critical, a 5/8"-11 threaded hub should be considered. This option eliminates the need for a separate lock nut, as well as the accompanying tooling.

As their 3-dimensional structure allows flap discs to last longer than other abrasives products, your replacement frequency may be minimal. The added time of using a separate nut to secure the flap discs to your grinder may not affect your production. For this, you may choose the 7/8" arbor hole, which will fit on your grinder regardless of thread pitch.

#### BACKING PLATE

The choice of backing plate is determined by the type of application. Aluminum backing plates are heavier and more rigid, which makes them best suited for harder grinding applications. Fiberglass backing plates are most common, and can be used on a range of light to moderate removal applications.

#### DENSITY

Flap quantity determines the density of flap discs. Compared to standard flap discs, high density discs are assembled with more flaps in the same area, and look much less compressed. High density flap discs are less aggressive, but will last longer than discs with a standard flap count.

The high density option is only available with our general purpose materials, as the function is best utilized by casual users.

#### SHAPE

The workable angle of a flap disc surface is in direct relation to the shape of the backing plate. Type 27, or flat faced discs, are to be used as parallel as possible to the work piece. This is not always convenient, depending on the restrictions of the work area. To combat this restriction, Type 29, or angle faced discs, provide a 10 degree angle to the abrasive surface. Working at the given 10 degree angle provides more leverage against the work piece, allowing more aggressive grinding and faster material removal.

# APPS & SOLUTIONS

## Mild Steel

### APPLICATION

Some common mild steel applications start with a 40 or 50 grit flap disc to quickly remove welds or surface imperfections. Flap discs should be versatile because they need to quickly remove material and have formidable cleaning properties. Choosing a flap disc with these performance factors may be challenging.

### SOLUTION

PREDATOR™ flap discs have been designed to meet the challenges of mild steel fabricators. Not only does the unique blend of grains provide a fast cut, our exclusive hard edge construction shows the most durability and life seen by any other flap disc. PREDATOR™ flap discs will deliver fast material removal while remaining flexible for general clean up and burr removal applications.

*Reference Lab Showcase 258 on Page 012*

## Stainless Steel

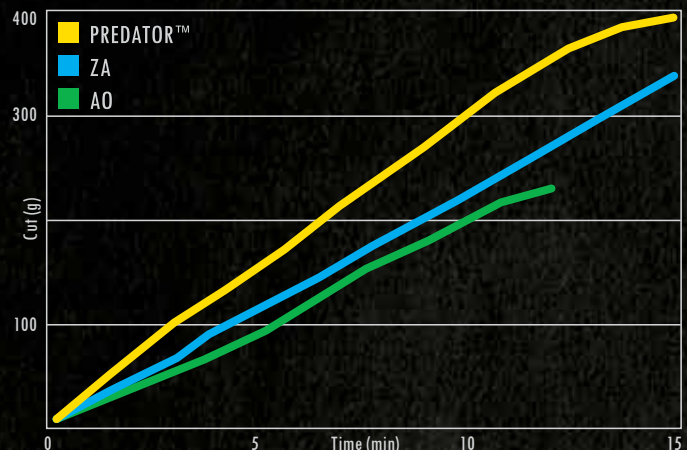

### APPLICATION

Stainless fabricators may choose flap discs over resin fibre discs because of their finer finish. The added ability for flap discs to perform general clean up duties, such as spatter and mill scale removal, also make them a popular choice.

### SOLUTION

The self-sharpening grains and optional hard edge shape of PREDATOR™ flap discs deliver fast material removal and excellent cleaning properties. PREDATOR™ flap discs can outlast the excessive heat generated from stainless grinding, especially compared to standard zirconia and aluminum oxide flap discs.

*Reference Lab Showcase 427 on Page 019*

## Aluminum

### APPLICATION

Although uncommon to use flap discs for heavy material or weld removal on aluminum, they can provide great control and last longer than a resin fibre disc. Flap discs are ideal when certain requirements are needed, such as a finer finish when removing a weld or a longer lasting cut while removing a burr.

### SOLUTION

To further decrease loading, Performance Coating can be added to PREDATOR™ flap discs. The integrated Performance Coating will lower the grinding temperature allowing a much faster cut and longer life.

# PRODUCT OVERVIEW

## PREDATOR™

Smaller diameter discs typically do not last long, due to the small amount of abrasive grain able to fit within the product surface. The self-sharpening grains of PREDATOR™ quick-lok discs outlast many others, and the two grinding aids further increase life by keeping the material cool. Aggressive grinding with quick-lok discs is easily achieved due to the proprietary construction of PREDATOR™ materials.

## PREDATOR™ Resin Fibre

Tough deburring and weld removal applications may wear or tear standard quick-lok disc backing materials. PREDATOR™ resin fibre quick-lok discs are made of the same thick, rugged, heat absorbing backing of resin fibre discs. Some flexibility is lost, but cut rates and product life are unsurpassed.

## Performance Coating

From the high RPM of a quick-lok disc application, excessive heat can quickly load the disc material with aluminum or other soft metals. This may be common and unavoidable with conventional quick-lok discs, but Performance Coating alleviates heat from the grinding process. Lab results have shown Performance Coated quick-lok discs cut as much as ten times faster than untreated discs.

# QUICK-LOK DISCS

## Compact Grain

The cluster, or agglomerate, that forms a compact grain is much different than conventional abrasives. Compact grains have multiple layers of the same grit – compared to only one layer of a conventional coated abrasive product. As an entire layer of abrasive grain is worn away, another layer is exposed. The compact grain construction results in less loading, longer life and a consistent finish.

If you were to convert conventional coated abrasives to the same compact grain grit size, compact grains will appear much coarser than their conventional abrasive equivalent; but, they are no coarser than the grit stated on the backing.

The unique manner in which compact grains wear away allow them to penetrate the hard structure of titanium and high nickel alloys, both very common materials for the aerospace industry.

In finer grits, such as 80 and 120, compact grain quick-lok discs have shown three-to-one performance over conventional aluminum oxide and silicon carbide discs. The stacked grain structure contributes less heat to the grinding process and leads to a faster cut and better life.

## Quick-Lok Disc Options

The small diameter of quick-lok discs leaves a small grinding footprint and allows the user to grind or polish in a space where a larger tool would not reach. A smaller footprint also allows the grind lines to stay tight to the weld area creating less secondary finishing work.

### BUTTON TYPE

The quick change mechanism allows fast product change-over with minimum tool down time. There are no performance differences between Type R and Type S buttons and the correct choice is only a matter of preference. Coordinating quick-lok disc holders are available for each diameter.

### MAXBAK™

Not as stiff as resin fibre quick-lok discs, MAXBAK™ quick-loks are a seamless blend of aggressive flexibility. MAXBAK™ is a proven choice for normal deburring and weld removal applications where a combination of flexibility, fast cut and long life are desired. MAXBAK™ quick-loks work well for blending corners and working on contoured surfaces.

### SINGLE-PLY

Quick-lok discs with a single-ply backing are popular with steel fabricators working on inside corners and tight, contoured surfaces. The single-ply backing is extremely flexible, yet sustains high edge retention for maximum benefit.

## Aerospace Applications Kit

Since 1960, we have been serving the aerospace industry with new and exclusive products. The Aerospace Applications Kit was carefully assembled to show the benefits of our exclusive aerospace products. The kit details product and process improvements tied to popular metal classes and applications in the aerospace market. These products will greatly improve your abrasive process at a lower cost, compared to competitor's.

Stocking programs are available to assist our distributor partners.

# APPS & SOLUTIONS

## Mild Steel

### APPLICATION

Weld removal and deburring in coarser grits are the most common quick-lok disc applications on mild steel sheet. The ability of a product to remove material quickly and stand up to sharp burrs and welds are the most important factors.

### SOLUTION

Our wide selection of backings can be utilized for high heat and tough deburring applications. The proprietary grains of PREDATOR™ provides mild steel fabricators the fastest cut available in the market. A fast cut and durable backing are critical for mild steel weld removal and deburring applications. PREDATOR™ discs offer the fast cut and long life that is essential for these applications. The wide range of backing options offer solutions for flexible to rigid applications.

*Reference Lab Showcase 267 on Page 021*

## Exotic Alloy

### APPLICATION

Titanium and high nickel alloys are involved in some of the most challenging applications. These hard metals do not respond well to controlled grinding and can quickly deplete the usable life of an abrasive. Poor performance has been generally accepted by using conventional, fine grit aluminum oxide, silicon carbide, or even costly full ceramic grains in coarse grits.

### SOLUTION

Forming silicon carbide into a compact grain structure alleviates the heat generated from hard metals. The manner in which compact grains breakdown during use is also beneficial to the harder exotic alloys. The layered construction of silicon carbide compact grains can provide life up to five times longer than conventional abrasive grains.

## Stainless Steel

### APPLICATION

The high heat applications of stainless steel, with the higher RPM of die grinders can quickly deteriorate the effectiveness of quick-lok discs. It is important to use a product that can control heat while delivering a high rate of removal. This requires certain use of heat resistant grains as well as heat reducing grinding aids.

### SOLUTION

The high concentration of select grains, and both size and top size grinding aids of PREDATOR™ quick-lok discs, compliments stainless steel applications very well. The range of backing options allow for additional life and controlled performance during stock removal or deburring.

*Reference Lab Showcase Sample on Page 011*

## Aluminum

### APPLICATION

Removal of spot welds, plasma cut burrs or machining marks are all common aluminum applications, and are all very different in nature. A diverse selection of products is needed to accomplish such a range of applications. Due to the high heat generated by using quick-lok discs, loading will also be an apparent issue.

### SOLUTION

For versatility, quick-lok discs offer several backing options, from contoured conformability to speed and aggression. Single-ply, MAXBAK™, and resin fibre backings are all available for our PREDATOR™ material.

Performance Coating is integrated to ensure a cooler cut, able to reduce or completely stop loading of soft metals. The coating is baked into the PREDATOR™ material and is especially effective when using a high speed product like quick-lok discs.

# QUICK-LOK DISCS

- Ideal for mild steel
- Type R and Type S mechanical locking button centers disc on tool with a twist
- Self-sharpening grains
- Cost effective option to full ceramic materials

- Fibre backing provides additional strength
- Fast cutting
- For aggressive applications

Additional items are available. Contact us for details.

# PRODUCT OVERVIEW

## SPECTRA™

Available in 5" or 6" roll, hook and loop, or with tab, SPECTRA™ Premium Paper Discs utilize a sturdy paper backing combined with a premium grain and steared surface. 5" and 6" discs may be available with 6 or 8 vacuum holes.

SPECTRA™ products are a seamless blend of affordability and performance for general purpose applications on all metals.

## PREDATOR™

An aggressive cloth PSA with both size and top size grinding aids, PREDATOR™ PSA discs deliver a fast cut with minimal loading. The technical grain combination of PREDATOR™ easily performs at a 3-to-1 cut rate over standard aluminum oxide and zirconia alumina discs. PREDATOR™ is available in both PSA and hook & loop backings, from 24 to 120 grit in a wide range of sizes.

# PSA DISCS

## Compact Grain

Compact grain is a unique product that has proven value in fine finishing applications – an ideal solution for PSA discs. While utilizing its clustered construction, expect longer life and similar finish to conventional aluminum oxide products.

## Film

Film options are ideal for inside corner and sharp edge grinding applications, due to the minimal thickness of the backing. Although extremely thin, film is durable and will not tear like most paper discs, but perform similarly to cloth backed discs.

## PSA Disc Options

### STANDARD DISCS AND DISC ROLLS

Our paper discs are available in both disc rolls or boxed together with a liner and tab. Cloth discs are only available with a liner; no disc roll available. 5" and 6" are the most common disc roll sizes.

### VACUUM HOLES

Available in 5, 6 or 8 hole format. Available in paper form.

### LARGE DISCS

Large discs will always be PSA and used on stationary machines found in maintenance and repair shops.

### PRESSURE SENSITIVE ADHESIVE

Regardless of the disc size, the PSA used must securely hold the disc to the pad or platen and easily be removed after the disc is finished. The disc must not leave any residue on the pad or platen as this would give an uneven grinding surface with the next disc.

If the platen is not kept clean, the adhesive from the disc will not allow it to secure properly. This will cause the disc to come apart from the platen and possibly injure the operator.

### TABS

As it is sometimes difficult to remove the liner from a fine grade disc, we add a tab to make the process easier. The tab is present on 60 grit and finer discs, 2" to 6" in diameter.

# APPS & SOLUTIONS

## Mild Steel

### APPLICATION

PSA and hook & loop discs are commonly used to administer the final finish of a part before painting. Different backing options are utilized depending on the geometry of the work piece. Large, rough areas with sharp burrs, corners and weld spatter would require a heavier cloth disc. Finer finishing and smoother surfaces, including paint, would use a paper disc.

### SOLUTION

When working on large areas that include sharp burrs, corners, weld penetration or spatter, PREDATOR™ cloth PSA discs are recommended.

When working on smoother surfaces with less spatter, requiring minimal cleanup, SPECTRA™ Premium Paper Discs can be used. The SPECTRA™ product line was designed as a seamless blend of affordability and performance.

*Reference Lab Showcase 328 on Page 013*

## Stainless Steel

### APPLICATION

Stainless finishing contains a wide range of application factors, and your use of a particular PSA disc will depend on the size, geometry and final surface requirement. All of these factors indicate the type of grain, backing, flexibility and size needed.

### SOLUTION

A definitive factor of stainless grinding is the excessive heat generated. PREDATOR™ PSA discs can control heat and extend cut with the proprietary selection of self-sharpening grains.

When seeking a finish finer than 120 grit, consider using an aluminum oxide compact grain. Compared to conventional, single layer abrasive grains, the compact grain provides a faster cut and extended life on demanding stainless steel finishing applications.

*Reference Lab Showcase 425 on Page 021*

## Aluminum

### APPLICATION

As a result of the slow action of orbital tooling on a flat surface, aluminum will quickly load into the grain structure, dramatically reducing the life and cutting power of the PSA disc.

### SOLUTION

Performance Coated PSA discs have the ability to cut 10 times faster and last 10 times longer than untreated discs. The Performance Coating is an integrated enhancement, producing a resilient, long lasting PSA disc that reduces heat during grinding. Abrasive grains can be fully utilized on aluminum with this product enhancement. Many fabricators have used Performance Coated discs to greatly reduce production costs and increase efficiencies.

*Reference Lab Showcase 277 on Page 016*

- Ideal for mild steel
- Self-sharpening grains
- Cost effective option to full ceramic materials

# PRODUCT OVERVIEW

## PREDATOR™ Type 1 Cut Off Wheels

Thin cut off wheels are designed for fast and accurate cutting and trimming. The accuracy of a cut depends on the thickness of the wheel. With tight tolerances, cutting or trimming with a thick wheel can disrupt accuracy, requiring more secondary work. It is important to choose the correct thickness for each application.

The industry standard in wheel thickness ranges from 0.030" to 0.125". PREDATOR™ Cut Off Wheels are offered in two widths - 0.040" and 0.0625" (or 1/16"). The thin dimensions of PREDATOR™ Cut Off Wheels prevent excessive material removal, allowing the wheel to last longer while producing finer cuts.

### Type 1 Standards

# BONDED

## Performance Coating

Cut off wheels generate a tremendous amount of heat, particularly on soft metal cutting applications. With the application of performance coating you will see a 50 to 60% increase in cutting speed when working on soft metals such as aluminum. While designed for soft metals, performance coating will deliver a 25% increase in cut and speed on all metals including mild steel, stainless steel, titanium, and nickel alloys.

## PREDATOR™ Type 27 Depressed Center Grinding Wheels

When using a depressed center grinding wheel for grinding and metal shaping it is important to have a wheel that can work on a variety of metals while delivering a great cut and life. PREDATOR™ Depressed Center Grinding Wheels will deliver dependable results on mild steel with superior results on harder metals such as stainless steel and high nickel alloys.

Representatives available for joint sales calls.

7 x 1/8 x 5/8"-11	807085805	60	8,700

- Depressed center design
- Reinforced with strong mesh fiberglass
- Available with 5/8"-11 hub for safety and no tool change
- Fast cut & long life
- Excellent for grinding welds
- 1/8" flexible wheels used with plastic support hub

## Jet Wheel Mandrel Set

1/4 x 3/8" or 1/4"	Item
<i>Pk Qty 1</i>	50690

- For 4" diameter cut off wheels or smaller
- Contents includes 1/4" shank adapter, 1/4" screw, 1/4" screw with 3/8" shoulder

# PRODUCT OVERVIEW

With sizes ranging from 1/8" wide to 600" in length in multiple grains and backings, we can deliver nearly any belt needed for your required application. The ARC ABRASIVES, INC. Custom Belt Program has set the industry standard. Our custom services and excellent application knowledge make it easy to deliver solutions directly to your shop floor.

## PREDATOR™

Quickly becoming our fastest growing product range, PREDATOR™ belts have a heavy Y-weight backing and proprietary grain structure, ensuring quality performance on a wide range of alloys. The combination of two grinding aids only reinforces its leading gram removal ratio.

## Performance Coating

Performance Coating is available for belts less than 12" in width. This product enhancement will add additional performance in aluminum applications.

## Compact Grain

Compact grain belts are best for finishing applications. With a grit range of 80 to 600, the clustered design delivers 3 to 1 performance when compared to conventional aluminum oxide products. Although aluminum oxide compact grain is excellent for mild and stainless steel applications, silicon carbide compact grain offers some of the industry's best grinding ratios for harder titanium and nickel alloys.

## Mild Steel

### APPLICATION

The most common belt applications performed by mild steel fabricators include inside corner weld cleanup and manual deburring of thermal and mechanically cut parts. Both of these applications require particular performance factors, including flexible backing, long lasting grains and cooling agents.

### SOLUTION

PREDATOR™ airfile belts are recommended for inside corner weld removal or general cleanup. To prevent breaking, PREDATOR™ belts are manufactured with a flexible backing and a strong butt joint. The technical grains used in PREDATOR™ materials will provide a fast cut, while the two grinding aids keep belts cool to increase life.

Also recommended is the use of PREDATOR™ on most benchstand applications. The durable PREDATOR™ backing is good for deburring all types of thermal and mechanically cut parts.

## Stainless Steel

### APPLICATION

From aesthetic to sanitary purposes, stainless steel finishing is performed on a wide variety of components. What may work well on stainless plate, may not work well on stainless sheet. Considering these factors, it is important to have a wide variety of technical grains, backings and grinding aids from which to choose.

### SOLUTION

Top performing stainless materials include PREDATOR™, which contains a durable backing and self-sharpening grains. The two grinding aids assist in cooling the stainless steel while grinding.

## Aluminum

### APPLICATION

Aluminum fabrication consists mainly of flash and gate removal by soft metal foundries. Other common applications include flat finishing aluminum for appearance or cleaning inside corner welds. All of these applications have loading issues due to the low melting point of aluminum.

While grinding, aluminum will melt into the grain structure of the abrasive creating excessive heat and accentuating the problem. Most aluminum fabricators use any particular abrasive based on cost, not performance, as they cannot utilize the technical advantages of certain grains.

### SOLUTION

Performance Coated belts decrease heat during the grinding process and dramatically increase cut and life on aluminum. It is not uncommon to see 3 or 4 times more cut and life in common aluminum belt applications. Performance Coating allows technical grains, such as zirconia alumina and ceramic, to reach their full potential on soft metals.

# SURFACE CONDITIONING

## Mild Steel

### APPLICATION

Mild steel fabricators use nonwoven materials in many product forms. Discs and belts are most commonly used for rust and mill scale removal, general deburring and refining coarse scratches before painting. Against a challenging range of applications, an equal offering grades, backings and grains are needed. The key to your application success is matching the correct choice in surface conditioning material.

### SOLUTION

The use of heavy duty products will produce a faster cut and longer life than ordinary nonwoven discs during mill scale removal scratch refinement. Also available is a wide range of surface conditioning belts, including no stretch and extra flexible to fit all application requirements.

## Stainless Steel

### APPLICATION

Stainless steel fabricators commonly use belts to achieve a desired finish on parts. Attaining a #4, #6, brushed or mirrored finish can be tiresome and involves many steps.

### SOLUTION

The conforming structure of nonwoven abrasives provides a consistent finish without removing excessive material, unlike coated abrasives. The wide range of surface conditioning products absorb heat exceptionally well, due to the open structure of the material. From working on open, flat areas with discs, to inside corner weld clean up with airfile belts, there is a product specifically designed to handle the cut and durability needed for your application.

## Aluminum

### APPLICATION

Scratch patterns are often removed before machined parts are painted. Some parts may be small or intricate and need a small diameter disc to perform the required operation. As small as parts may be, excessive heat is still generated and can cause loading. Shortened life from loading is common in rotary applications using quick-loks and discs.

### SOLUTION

Performance Coated surface conditioning products will reduce loading in all product forms, such as belts, quick-loks and discs. Applications that create the most heat, like quick-lok discs, will benefit greatly from Performance Coating.

# SURFACE CONDITIONING

- Size range of 1/8 - 1" width; up to 30" length
- Premium surface conditioning material evenly coated with grit from material surface to base
- Even coating provides improved performance in deburring and edge applications
- Low stretch material for applications with high belt tension
- Performs a wide variety of tasks including deburring, flat finishing and finishing on edges
- Can be used on a variety of metals

# CARTRIDGE ROLLS

- Multi-layer coiled construction
- Exposes sharp new cutting abrasive as each layer wears
- Ideal for finishing operations
- Irregular concaves, contours, dead-end holes, channels
- Deburring, blending tool mark removal
- Flash removal

## Eyelet Mandrels

*Pk Qty 10*

Size	Item
3-48 x 1/4"	50328
8-32 x 1/4"	50329
1/4-20 x 1/4"	50330

# PADS

- Layered construction of material, formed as a square
- Chatter-free grinding
- Intermittent strokes of pad corners improve visibility
- Corners very aggressive until edges round
- When corners are round, good for polishing
- Excellent for blending welds inside of pipes

- 4/S Available
- Exceptional balance at high RPM
- Extremely flexible and durable
- Unique shape allows you to reach inaccessible areas
- Light removal of matter inside of pipe
- Blends surface imperfections within pipes

## Square Pads

1-1/2 x 1/2 x 1/4-20	Item	Grit	Max RPM

NO LAP BANDS

# NO LAP BANDS

- Inner cloth liner adhered to band for extra durability
- Inner liner prevents slippage while being used on an expandable drum
- No tooling for operator
- Great in curved and contoured areas
- Fast cutting yet leaves smooth, even finish

## No Lap Bands

## Our Story

In 1960, Zerla and Si Stayman's dream of starting their own business came true in the Midwest town of Troy, Ohio. ARC ABRASIVES, INC. was born by using a MixMaster to create the adhesive for the company's first product – the PSA disc. Due to the success of their growing product line and dedication to quality, ARC ABRASIVES, INC. grew from a start up with five people in a rented garage, to a thriving and dynamic business in Troy, Ohio supported by nearly 100 employees. Today ARC ABRASIVES, INC., under second generation ownership by the Stayman's son, Anthony, continues to develop new technologies and products, including the highly successful PREDATOR™ line. ARC ABRASIVES, INC. is one of America's largest abrasives converters, proudly supporting American manufacturing companies.

## Our Philosophy

Since 1960, ARC ABRASIVES, INC. has defined commitment as the process of understanding customer needs. We go beyond selling products – we evaluate applications to provide individual metalworking solutions. Our goal is to create cost savings and process improvements for our customers.

This catalog showcases the depth of our knowledge and experience within the metalworking markets, including detailed lab reports and case studies. Successful product development depends on our ability to work in the field to determine the needs of our customers. Understanding how our products work within our vertical segmentation of weld removal, deburring and flash removal, and surface finishing allow us to develop innovative and unique products for you.
